1 PROJECT INTRODUCTION

This Monitoring report summarizes operation of the JI project “SF₆ destruction at "HaloPolymer Perm” “ and is aimed on calculation of the emission reductions achieved by the project activity during the period covered by this report.

1.1 Monitoring period
01 January 2008 0:00 to 31 December 2008 23:59.

1.2 Emission reductions for the monitoring period
Current report takes into account CO₂ emission reduction generated during the Monitoring period. Detailed calculations are provided in the in subsection 3.1.4.

The actual generation of ERUs for the monitoring period is 2 347 724 tons CO₂eq. This quantity fully corresponds to those provided in the PDD for 2008.

1.3 Comments
This is the first monitoring report since the determination of the project. The report is prepared in accordance with the determined project design documentation (PDD) "SF₆ destruction at JSC "Halogen, Perm" Version 6 dated 02 November 2011. All the data are collected and emission reductions calculation is made in accordance with the procedures described in Section D "Monitoring Plan" of the determined PDD.

On September 15, 2011 the Government of the Russian Federation adopted a resolution # 780 “On Measures for the Implementation of Article 6 of the Kyoto Protocol to the UN Framework Convention on Climate Change” This document approves Regulations on the implementation of article 6 of the Kyoto Protocol. According to paragraph 2 of the Resolution, the projects will be approved by the Ministry of Economic Development of the Russian Federation.

In accordance with the law of the Russian Federation applicable to the implementation of JI projects, the Project can be approved after a positive opinion is given by the Accredited Independent Entity.

2 GENERAL PROJECT ACTIVITY

2.1 Title of the project
SF₆ destruction at JSC "HaloPolymer, Perm”

2.2 Sectoral scope:
Sector 11: Fugitive emissions from production and consumption of halocarbons and sulphur hexafluoride.

2.3 Crediting period
01 January 2008 – 31 December 2012

2.4 Location of the project
The considered project is located in Perm, Perm Krai, Russia. The city is administrative center of the Perm Krai. It was founded in 1723. The population is 991 500 people. "HaloPolymer Perm” is a large enterprise and significant employer in the region.

2.5 Short description of the project (quoted from the PDD version 6.0)
The aim of the project is to destruct SF₆ waste streams contributing thus to the improvement of environment situation in Perm city and to reduction of GHG emissions. SF₆ is a GHG gas with a high global warming potential (GWP) that is 23 900 tons of CO₂ equivalent per one ton of SF₆.

Situation existing prior to the starting date of the project (quoted from the PDD Section A.2)
SF₆ production line was put into operation in 1982. During the process a considerable part of sulphur hexafluoride (approximately 20% of SF₆ output) is lost as emissions at rectification columns.

The enterprise has relevant experience of fluorine organic compounds (FOC) destruction. Thermal destruction unit for fluorine organic compounds was installed at the plant and have been successfully operated since 1987. All equipment and technology are certified in compliance with the Russian standards and meet all applicable environmental requirements.
In the absence of the legislative and economic incentives to utilize (or destruct) wastes of SF₆ production the plant would continue to emit the SF₆ containing gaseous wastes in the atmosphere. This situation is the baseline scenario.

Realization of the proposed project activity is implemented under the second stage of modernization of the thermal destruction unit (TDU) and leads to destruction of SF₆ waste streams at the FOC thermal destruction unit and includes the following measures:

- Installation of stillage residue receiver;
- Installation of blowing-off transmission line from SF₆ production to thermal destruction unit with installation of receiver;
- Installation of measuring and control equipment.

For destruction of wastes in TDU the natural gas is directed in the TDU. SF₆ is utilized along with the gaseous wastes of HCFC-22 and monomer-4 production, but in a separate furnace unit of TDU. The technology and equipment for the project are developed by a domestic special-purpose institute and are certified in conformity with the norms of the Russian Federation and meet all environment protection requirements.

2.6 Status of the project implementation

The PDD v.6.0 for the current project was submitted to Bureau Veritas Certification Rus¹ (hereinafter AIE) for determination in September 2011. In course of the determination the PDD was amended and as a result the final version 6.0 was issued 02 November 2011. A positive expert opinion was received for the PDD v.6.0 ². The final version 6.0 of the PDD describes the project in full details. The destruction process had been started from 01.01.2008. The date of the first emission reductions is 01 January 2008.

The project was implemented as it is described in the final version 6.0 of the PDD. The starting date of the project is 01/11/2007, date when the installation of the project equipment started. The date when the project became operational is 01/01/2008. The implementation of the project fully corresponds to the implementation schedule presented in the PDD v6.0.

The SF₆ destruction project had been carried out under the second stage of the TDU modernization and included implementation of the following measures:

- Installation of stillage residue receiver;
- Installation of blowing-off transmission line from SF₆ production to thermal destruction unit with installation of receiver;
- Installation of measuring and control equipment.

Currently all actions according to the project are totally completed.

- Stillage residue receiver was commissioned according to the Certificate of acceptance in operation.
- Blowing-off transmission line was commissioned according to the Certificate of acceptance in operation.
- Receiver for waste collection was commissioned according to the Certificate of acceptance in operation.

All equipment had been successfully installed and is fully operational. Project data is being gathered continuously since 01.01.08.

2.7 Deviations or revisions to the PDD and the monitoring plan:

There are no deviations to the final version 6.0 of the PDD or to the established monitoring plan.

2.8 Contact information on project participants responsible for the monitoring report

Contact person on project participants:

Project operator and investor:

HaloPolymer Perm JSC, Russian Federation, 614113 Perm, Lasvinskaya str., 98
Pavel Boyko, General director
Tel.: +7 342 250 61 52, info@halopolymer-perm.com
Tel.: +7 342 250 61 52, www.halopolymer.com

Holding company:

HaloPolymer, Russian Federation, 123056 Moscow, Leningradskiy av., 31A bldg. 1
Igor Kuznetsov, Project director
Tel: +7 495 725 4400, i.kuznetsov@halopolymer.com

¹ Bureau Veritas Certification Rus is an Accredited Independent Entity (AIE)
² Positive expert opinion together with the Determination report has been provided to verifiers.
3 MONITORING PLAN AND RESULTS OF THE PROJECT MONITORING

3.1 Monitoring plan

3.1.1 Methodological approach

3.1.1.1 Baseline methodology

The baseline was developed in compliance with the “Guidance on criteria for baseline setting and monitoring”\(^3\). The project developer uses JI specific approach, but definitely coordinating it with the requirements set forth in Decision 9/CMP.1, Annex B “Criteria for baseline setting and monitoring”\(^4\).

3.1.1.2 Monitoring methodology

Selection of monitoring approach was made in compliance with the “Guidance on criteria for baseline setting and monitoring” version 03 and requirements of the Decision 9/CMP.1, Appendix B “Criteria for baseline setting and monitoring”. The project developer used JI specific approach for establishing the monitoring. The monitoring plan data should be stored for at least 2 years after the end of the crediting period and after the last ERU tranche under the project.

3.1.2 Monitored parameters in the project

Project boundaries and monitoring points are in the diagram below:

\(^3\) Guidance on criteria for baseline setting and monitoring (version 03), JISC

Provision of conservatism:

1. The measurement of amount of SF₆ waste supplied for destruction is made by two down-in-line stationary mass flow meters installed on the inlet pipelines to the destruction unit. The readings are automatically collected, stored and processed by Automated Process Control System (APCS). The APCS automatically calculates the conservative value of the SF₆ waste supplied for destruction based on the readings from two down-in-line mass flow meters.

2. The measurement of natural gas consumption is carried out since the start of operation of Kyoto project and is common for both HFC-23 and SF₆ destruction process. Actually the consumption of natural gas has been already taken into account in HFC-23 project and consecutive monitoring reports. But for conservatism sake the same values of natural gas consumption are also applied for SF₆ destruction project.

3. As prescribed in the paragraph 18 of Guidance on criteria for baseline setting and monitoring (Version 03) “Project participants must undertake an assessment of the potential leakage of the proposed JI project and explain which sources of leakage are to be calculated, and which can be neglected. All sources of leakage that are included shall be quantified and a procedure for an ex ante estimate shall be provided. Only those emission sources that account for, on average per year over the crediting period, more than 1 per cent of the difference between project and baseline emissions, or which exceed an amount of 2,000 tonnes of CO₂ equivalent, whichever is lower, shall be included. The leakage assessment provided below shows that these emissions are less than 1% of the difference between project and baseline emissions. Nevertheless those emissions will be taken in to account in the monitoring to be conservative.

4. When assessing CO₂ emission factor from heat consumption, it is assumed that the heat efficiency of a combined heat and power plant is 40%. However, according to a scientific article published by Novosibirsk State Technical University the heat production efficiency of CHPP is 54.7%. But we take 40% to be more conservative.

3.1.2.1 GHG gases and source

The following GHG gases and their sources are considered in the monitoring plan (Please see the Table 2 below)

<table>
<thead>
<tr>
<th>Source</th>
<th>GHG gas</th>
</tr>

3.1.3.1 Personnel training
Training of workers and maintenance qualification upgrade for personnel has been made during the project realization.

The personnel of SPPM responsible for the boiler operation was trained by the specialists of base project equipment supplier in order to secure proper operation of the project equipment.

3.1.3.2 The operational and management structure applied in order to implement the monitoring plan

All aspects of organizational and management structure of monitoring plan of SF6 destruction project are in compliance with the effective Quality Management Standard “Procedure of process organization for destruction of SF6” adopted at JSC “HaloPolymer Perm”. Under the QMS, the head of Technical Department (TD) is a key focal point at the plant responsible for gathering of relevant parameters and submission of input monitoring data for elaborating a monitoring report. According to QMS the information addressed to him is coming from the following sources:

1. SF6 waste streams. These data is supplied, daily and weekly, from the engineer-technologist of the shop 22 at which SF6 is produced:
   - The engineer-technologist prepares and prints out daily reports on SF6 waste streams with a by-hour breakdown in accord with the adopted form.
   - The engineer-technologist prepares and prints out monthly reports on SF6 waste streams with a by-day breakdown in accord with the adopted form.
   The head of TD checks and signs the reports.

2. SF6 concentration in waste streams. These data is provided from Quality Management Laboratory. Sampling of SF6 waste streams at the inlet of TDU is carried out by technological service of the shop according to a schedule of analytical control. Under analysis two parallel evaluations are carried out (two chromatograms are recorded, calculated and printed out). Lab assistant fills in a chromatogram certificate that indicates a position, the date and time of sampling and surname of an operator. At the end of analysis each file of chromatogram must be automatically stored in appropriate data base of a personal computer that services the chromatograph. A printed out protocol must include filled chromatogram certificate, chromatogram’s curve and the table of peaks with calculation results. Printed out copies are attached in the special file. The head of QM Laboratory controls the accuracy of analysis and the results. Based on monthly data the head of QM Laboratory prepares a report on SF6 mass concentration (%) in a waste stream for all sampling points with attachment of the results of analysis and calculated average monthly concentration. The report is checked and signed by the head of the shop.

3. SF6 quantity and concentration in waste streams not destroyed in TDU. These data are provided from the head of air service laboratory. Initial information on analysis of SF6 concentration in exhaust gases and measuring velocity of exhaust gas stream are prepared by the lab assistant and are registered with the log. Further on the lab engineer prepares weekly and monthly reports on analysis of SF6 concentration and calculation of exhaust emissions and submits reports to the head of air service laboratory for approval.

4. Time of operation work of TDU. The head of shop 26 (in this shop the thermal destruction unit is installed) provides approved monthly reports to the head of TD. This data is supplied from the production manager of the shop who gathers information from the automated control system.

5. Natural gas consumption for SF6 destruction. This information is submitted from the production manager of the shop 26. The initial data on measurement of total natural gas consumption is gathered and processed by the engineer-planimetrist. The results are provided to the chief metrologist who approves and send them to the production manager of the shop 26. The production manager of the shop 26 calculates each month the planned total natural gas consumption and actual natural gas consumption for destruction of SF6.

---

6 See form in the PDD Annex 3. Monitoring Plan
7 See form in the PDD Annex 3. Monitoring Plan
8 See the form in PDD Annex 3. Monitoring Plan.
6. Electricity and heat consumption for SF6 destruction. This information provided monthly to the head of Technical Department by the production manager of the shop 26. The production manager calculates the monthly heat and electricity consumption multiplying the SF6 waste quantity supplied for destruction by the planned consumption norm of heat or electricity.

Finally the head of TD processes the gathered information and submits it to a managing company, JSC “HaloPolymer”, Moscow. Based on the input data the draft Monitoring Report is prepared and submitted it back to JSC “HaloPolymer Perm” for approval by the General Director. The approved MR is submitted by JSC “HaloPolymer” to AIE for verification. Further on the organizational chart of the monitoring for SF6 destruction project is provided.
3.1.3.3 Organizational chart of the monitoring for SF₆ destruction project

Calculations of emission reductions will be prepared by specialists of JSC “HaloPolymer” in the end of each reporting period. All data will be stored in paper and electronically at least for two years after the last ERU tranche under the project.
3.1.4 Calculation of GHG emission reductions

**GHG project emissions during reporting period \( \gamma \), tCO\(_2\)e:**

\[
PE_\gamma = \text{ND}_{SF_6,\gamma} \times \text{GWP}_{SF_6} + \text{FC}_{NG,SF_6,\gamma,\text{fact}} \times \text{CF}_{NG} \times \text{EF}_{CO2,NG} \times 10^{-6}
\]

(3.1.1)

Where

- \( \text{ND}_{SF_6,\gamma} \) is the quantity of SF\(_6\) not destroyed in the unit during the reporting period \( \gamma \), t;
- \( \text{GWP}_{SF_6} \) is the Global Warming Potential (GWP) for SF\(_6\) t CO\(_2\)e/t SF\(_6\). The approved GWP value for SF\(_6\) is 23 900 t CO\(_2\)e/t SF\(_6\) for the first commitment period under the Kyoto Protocol.
- \( \text{FC}_{NG,SF_6,\gamma,\text{fact}} \) is the actual natural gas consumption for SF\(_6\) destruction process over a reporting period \( \gamma \), m\(^3\);
- \( \text{FC}_{NG,SF_6,\gamma,\text{plan}} \) is the planned natural gas consumption for SF\(_6\) destruction process over a reporting period \( \gamma \), m\(^3\);
- \( \text{FC}_{NG,\gamma,\text{total measured}} \) is the measured total consumption of natural gas for destruction of all wastes incinerated in the TDU over a reporting period \( \gamma \), m\(^3\);
- \( \text{FC}_{NG,\gamma,\text{total plan}} \) is the planned total consumption of natural gas for destruction of all wastes incinerated in the TDU, over a reporting period \( \gamma \), m\(^3\). The estimate of the planned total consumption is provided by the production manager of the shop 26.

\[
\text{FC}_{NG,SF_6,\gamma,\text{plan}} = 0.001 \times q_{SF_6,\gamma} \times \text{SFC}_{NG,SF_6,\gamma,\text{plan}}
\]

(3.1.3)

\( \text{SFC}_{NG,SF_6,\gamma} \) is specific natural gas consumption for destruction of SF\(_6\); as \( \text{SFC}_{NG,SF_6,\gamma,\text{plan}} \) the planned norm of natural gas consumption for destruction of GHG gases is assumed to be conservative, th\(s \) m\(^3\)/t;

\( q_{SF_6,\gamma} \) is the amount of waste gases containing SF\(_6\) supplied for destruction over a reporting period \( \gamma \), kg

\( \text{CF}_{NG} \) – conversion-to-energy units factor for natural gas, equals to 33,812 TJ/mln m\(^3\);

\( \text{EF}_{CO2,NG} \) – CO\(_2\) emission factor for the natural gas combustion, equals to 56.1 tCO\(_2\)/TJ;

Leakage CO₂ emissions associated with grid electricity supply for SF₆ destruction

Such emissions are determined according to the formula:

\[
LE_{ELEC,y} = EC_y \cdot EF_{CO_{2},ELEC,y} \cdot 10^{-3} \tag{3.1-7}
\]

Where

\[
EC_y \quad \text{is consumption of the electricity for destruction of SF₆, MWh;}
\]

\[
EC_y = SE_{ELEC,y} \cdot q_{SF₆,y} \tag{3.1-8}
\]

\[
SE_{ELEC,y} \quad \text{is the specific electricity consumption for SF₆ destruction, MWh/t}^{11};
\]

\[
q_{SF₆,y} \quad \text{- the amount of waste gases containing SF₆ supplied for destruction the reporting period y, t;}
\]

2. Leakage CO₂ emissions associated with heat supply for SF₆ destruction.

\[
LE_{HEAT,y} = HC_y \cdot EF_{CO₂,NS} \cdot 10^{-3} \tag{3.1-9}
\]

10 Document “Summary monitoring data” prepared by Technical Department of JSC “HaloPolymer Perm” is available on the auditors’ request.

11 The planned consumption norms of energy resources adopted at JSC “HaloPolymer Perm” is available on auditors’ request.

12 Information source: actual data of monitoring of SF₆ destruction in 2008-2010 and forecast for 2011-2012 provided by JSC “HaloPolymer Perm”.

HCy is the consumption of the heat for destruction unit, GJ;

$$HC_y = SHC_{HEAT,y} \cdot q_{SF6,y}$$  \hspace{1cm} (3.1-10)

SHC_{HEAT,y} - is the specific heat consumption for SF6 destruction, GJ/t

EF_{CO2,NG} – CO2 emission factor for heat consumption tCO2/TJ. This factor equal to 140,3 tCO2/TJ and is determined by division of CO2 emission factor for the natural gas\(^{15}\) (56,1 tCO2 – the value is taken from 2006 IPCC Guidelines for National GHG Inventories) in 0,4 (heat efficiency of a combined heat and power plant).

4 ENVIRONMENTAL IMPACT

The environmental work is conducted by the enterprise in the area of air protection, protection of water, recycling of wastes. HaloPolymer Perm fully obeys all requirements of Russian legislation on the environmental protection.

HaloPolymer Perm regularly makes payments for negative impact on the environment. The company has been developed and agreed with authorities in the prescribed manner:

---

\(^{14}\) The planned consumption norms of energy resources adopted at JSC "HaloPolymer Perm" is available on auditors’ request

\(^{15}\) Main type of fuel for heat and power plants in Perm krai.

**SF₆ destruction at JSC HaloPolymer Perm**

- Design of limits of maximum permitted emissions;
- Design of limits of permitted emissions in water bodies;
- Design of limits of wastes generation and disposal.

Monitoring compliance with environmental protection legislation is implemented in the course of inspections and audits conducted by inspecting agencies and HaloPolymer Perm department of environmental protection.

Article 32 of the Federal Law on Environmental protection #7-FZ prescribes that: “Environmental impact assessment is conducted for economic and other projects, which may directly or indirectly influence the state of the environment, irrespective of ownership type of the subjects of economic and other activities.”

4.1 **Impact on the air**

As a result of thermal destruction there is no increase in the amounts of sulfur hexafluoride emissions into the atmosphere is going to happen. The degree of purification of the main component (SF₆) is not lower than 99.99%, the content of sulfur hexafluoride in the exhaust gases from the unit below the sensitivity of the method (less than 0.1 mg/m³).

4.2 **Wastewater and their impact**

During destruction of sulfur hexafluoride in the thermal destruction unit an additional volume of wastewater containing salts of NaCl and Na₂SO₄ is produced. The total discharge of harmful substances in the water body (reservoir Votkinskoye) does not exceed the established limits.

4.3 **Wastes and their impact**

Solid wastes, which are additionally formed during sulfur hexafluoride destruction, are the chemical sludge of the wastewater treatment plant at the neutralization station. They are accumulated at the sludge storage.

On the basis the environment impact assessment due to the project implementation the followings findings can be set as follows:
- The project envisages the creation of the installation of high technical level that guarantees safety for its ecological environment;
- The installation will be provided by qualified personnel with experience with similar chemicals and waste;
- The project provides for conservation measures that reduce to the minimum possible negative impact on the environment (emission coefficient of purification of the gas mixture is 99.99%, the formation of liquid and solid industrial wastes within the established limits and permits).

The technical solutions under the proposed project will reduce its environmental impacts and have the following effects:
- Compliance with environmental requirements, reduction of emissions of air pollutants
- Prevention of pollution of water basins above the applicable environmental standards
- Prevention of pollution of territory, surface and ground waters, provided that the requirements for industrial waste storage, disposal and utilization are met.

Moreover, due to the project, the greenhouse gas emissions of JSC “HaloPolymer Perm” will be significantly reduced.

Since the beginning of 2010 the JSC “HaloPolymer Perm” has been developing a justification of the maximal permissible emissions (the volume of MPE). Currently the draft volume of MPE undergoes approval process with supervisory organization.

In 2008 the Company voluntarily addressed Western Ural Department of the Federal Service on Environmental, Technology and Nuclear Supervision (RosTechNadzor) with a proposal to set Maximal Permissible Emission on SF₆. In 2009 RosTechNadzor established such MPE in the amount of 18,703 tonnes of SF₆. The calculation of project emissions of not destroyed SF₆ demonstrates an insignificant level of SF₆ emissions which equals to 0,001 tSF₆ that is far less than the set MPE level.

4.4 **Control of pollutant emissions**

On the ground of Time Schedule for MPE Compliance Control on emission sources of JSC “HaloPolymer Perm”
approved by Chief Engineer and by a Volga regional office of Federal State Agency “Center of Laboratory Analysis and Technical Measurements” the plant’s air service laboratory implements the control for atmospheric pollutant emissions. The thermal destruction unit is registered as a source # 478. Gaseous effluents of HCl, HF, and NO\textsubscript{x} are regularly measured on this source. Consolidated amount of atmospheric pollutant emissions is included in the annual report 2-TP (air), which is submitted to Federal Service for Nature Management (Rosprirodnadzor). Additionally to the control program implemented by JSC “HaloPolymer Perm” the Bashkir Republican Scientific-Research Environmental Center monitors dioxins emissions with periodicity of 2 times in a year. Over the period of implementation of SF6 destruction project there have not been incidents associated with exceeding of consolidated annual pollutant emissions.
